1.0 | | 12 2026

Purpose: Build a real, installable Android application for Joypurhat residents, visitors and tourists. This document describes the product, design, features, data requirements and delivery expectations.

1. Project Overview

Working name: JOYORA (the owner may rename it later).

Platform: Android phone application, with a scalable backend and secure admin panel.

Create a modern, colorful, premium and easy-to-use all-in-one local information and service platform for Joypurhat District, Bangladesh. It must help people discover verified local services, institutions, businesses, transport, places and heritage information in one place.

Important: Deliver a functioning application, not only mockups, screenshots, a static website or a UI-only prototype.

2. Welcome Screen / Onboarding

- Show the official app logo and the app name JOYORA.
- Display authentic, high-quality photographs of notable and beautiful places in Joypurhat.
- Automatically change the displayed photograph every 10–15 seconds with a smooth transition.
- Allow manual swipe navigation and show slide indicators.
- Include a clear Get Started button. Tapping it opens the Login / Registration flow.
- Use a short tagline such as: “Discover Joypurhat. Experience Everything.”
- At the bottom, show the credit exactly as: “Founder & Created by Saberin Sheikh”.
- Do not show the founder’s personal photograph. Keep the credit small, elegant and unobtrusive.

3. Login and Registration

Provide registration for new users and login for existing users. After successful registration or login, take the user to the main dashboard. Include form validation, useful error messages, forgot-password and password-reset flows.

Registration fields and required status

Field	Requirement
Profile Picture	Optional
Full Name	Required
Gmail / Email Address	Required
Password	Required
Phone Number	Required
Gender	Required
Blood Group	Required
District	Required
Upazila / Police Station	Required

Selection options

- Gender: Male, Female, Other. Required; no option preselected.
- Blood group: A+, A–, B+, B–, AB+, AB–, O+, O–. Required; no option preselected.
- Profile picture is optional.
- District and Upazila/Police Station must be selected or entered clearly. For Joypurhat, support Joypurhat Sadar, Panchbibi, Kalai, Khetlal and Akkelpur.
- Support Google Sign-In if practical, alongside email/password authentication.

Protect personal information. Store passwords only through a secure authentication provider; never store plain-text passwords. Do not expose a user's phone number, gender, blood group, email or profile details publicly. Explain why personal data is collected and obtain consent.

4. Language System: Bangla and English

- Support ■■■■■ (Bangla) and English throughout the entire app.
- Default language: Bangla.
- Provide a visible language selector, for example ■■■■■ | English.
- When the user changes language, every app-owned label must change: menus, buttons, categories, navigation, settings, validation messages, notices and other interface text.
- Save the selected language so it remains selected after closing and reopening the app.
- Do not mix languages unnecessarily. All content entered by administrators should support Bangla and English fields where relevant.

5. Main Dashboard and Visual Design

- Create a colorful, modern, premium dashboard that remains clean and easy to navigate.
- Use attractive category cards, clear icons, rounded corners, balanced spacing and subtle shadows.
- Give each category a distinct but harmonious color. Avoid excessive gradients, clutter or overly bright colors.
- Show a personalized greeting such as "Hello, [User Name]".
- Include a prominent search bar with a prompt such as "Search anything in Joypurhat…".
- Show key categories and an Explore by Upazila section without overcrowding the home screen.

Suggested category colors

- Healthcare: light blue; Emergency: soft red; Transport: green; Hotels: warm orange; Restaurants: golden yellow; Education: purple; Business: teal; Tourism: deep green; History & Heritage: navy and gold.

6. Main Categories and Content

Hospitals & Healthcare

- Government and private hospitals
- Clinics and diagnostic centres
- Doctors and chambers
- Pharmacies
- Ambulance services
- Blood donation information

Emergency Services

- Police stations
- Fire service
- Ambulance
- Emergency contact numbers
- Important government emergency contacts

Transport & Communication

- Bus services and counters
- Train schedules and railway stations
- Auto-rickshaw, CNG and local transport information
- Routes and travel information

Hotels & Accommodation

- Hotels, residential hotels and guest houses
- Contact numbers, addresses and map locations

Restaurants & Food

- Restaurants, cafes and local food shops
- Famous local dishes and food heritage

Education

- Schools, colleges, madrasas and other educational institutions
- Coaching centres

Business & Shopping

- Shopping malls and local markets
- Mobile phone shops, electronics and clothing stores
- Supermarkets and other local businesses

Tourism & Places to Visit

- Historical places and tourist attractions
- Natural attractions, parks and recreational places
- Photographs, descriptions and directions

History & Heritage of Joypurhat

- District history and historical landmarks
- Local culture and traditions
- Nakshi Kantha and traditional crafts
- Traditional foods and cultural heritage

Agriculture & Local Products

- Potato production and agricultural products
- Sonali chicken / golden chicken and local poultry
- Local farming, agricultural markets and notable products

News & Announcements

- Local news and important notices
- Public announcements and government updates
- Community information

7. Upazila-Based Navigation

Create separate browseable sections for all five Joypurhat Upazilas:

- Joypurhat Sadar
- Panchbibi
- Kalai
- Khetlal
- Akkelpur

Users should be able to browse services and listings by Upazila. Each listing should be associated with the correct Upazila and, where possible, a more specific locality.

8. Search

- Search by institution/business name, category, location, Upazila and service type.
- Support Bangla and English search terms where possible.
- Show clear results with category, address and relevant contact/location actions.
- Provide useful empty-state messages and allow users to clear or refine searches.

9. Listing Details and Maps

Each relevant listing should support the following fields, when applicable:

- Name and category
- Short description
- Full address and Upazila
- Phone number with tap-to-call action
- Google Maps location and Get Directions action
- Photographs, where available and authorized
- Last verified date

Tapping a map action should open Google Maps or another suitable map application. Never invent addresses, phone numbers, opening hours, coordinates or business details.

10. Favorites and Bottom Navigation

- Allow users to save places and services to Favorites.
- Provide a simple bottom navigation bar: Home, Explore, Favorites and Profile.
- All navigation labels must switch correctly between Bangla and English.
- Keep emergency information accessible even when the user is not logged in.

11. User Profile

- Profile picture, full name, email and phone number
- Gender, blood group, district and Upazila
- Edit profile and change password
- Language settings and logout

- Keep all personal profile information private by default.

12. Admin Panel and Content Management

- Create a secure, separate admin panel with role-based access control.
- Allow authorized admins to add, edit, verify, publish, unpublish and delete listings.
- Manage hospitals, clinics, doctors, pharmacies, emergency contacts, transport, hotels, restaurants, schools, businesses, tourist places, news and notices.
- Upload and manage photographs, phone numbers, addresses and map locations.
- Manage Bangla and English versions of names, descriptions and notices.
- Review user-submitted correction reports and approve or reject them.
- Maintain an audit trail for important edits and identify which admin made each change.

13. User Correction and Reporting

Allow users to report incorrect or outdated information, such as a wrong phone number, changed address, closed institution or incorrect map location. Send reports to the admin panel for review. Do not publish user-submitted changes automatically without moderation.

14. Data Accuracy, Safety and Privacy

- Publish verified information only. Clearly mark information that has not yet been verified.
- Show a last-verified date on important listings.
- Keep emergency contacts easy to find and available without login.
- Use secure authentication, database access rules and protected admin roles.
- Collect only data that is necessary. Explain the purpose of collecting personal information.
- Do not expose user profiles or sensitive registration fields to other users.
- Provide a way to report inaccurate, harmful or outdated content.

15. Logo and Brand Identity

Create a minimal, memorable and internationally recognizable logo representing Joypurhat. The concept may draw inspiration from the district map, Sonali chicken, potato/agriculture and local heritage, including a subtle Nakshi Kantha-inspired detail. Combine these ideas into one unified symbol rather than placing many separate illustrations in the logo.

Preferred palette: Dark Navy Blue, Golden and Deep Green. The logo must remain recognizable at small sizes and work as an Android launcher icon, welcome-screen logo and Play Store icon.

16. Suggested Technology

The developer may recommend the best maintainable stack. Suggested options:

- Flutter or native Android using Kotlin
- Firebase Authentication or an equivalent secure authentication service
- Cloud Firestore or another suitable database
- Firebase Storage or equivalent for images
- Google Maps integration

- Secure backend APIs and database security rules
- A responsive web-based admin panel

Document all required API keys, paid services, external accounts and setup steps. Do not embed secret keys in public source code.

17. Android Build and Required Deliverables

Primary requirement: I need an actual installable APK that I can download and install on my Android phone for testing.

- First deliver an installable MVP APK with working navigation, welcome slideshow, registration/login screens, language switching and dashboard.
- Provide the complete source code and project structure.
- Provide backend/database configuration and admin-panel source or deployment instructions.
- Provide the app logo, icons and required image assets.
- Provide clear build, configuration and installation instructions.
- Provide a signed release APK. Provide a Play Store-ready AAB when appropriate.
- Test the APK on a real Android device or emulator and report what has and has not been tested.
- Do not describe a ZIP, screenshot, mockup or non-installable prototype as an APK.
- If backend credentials, API keys or an owner-created Firebase/Google project are needed, list the exact steps and let the owner create or securely provide them.

18. About App and Founder Credit

Include an About Application page with the app name, logo, version, purpose, founder credit and copyright information. Display the following credit elegantly on the Welcome Screen and About page:

Founder & Created by Saberin Sheikh

19. Development Plan and Acceptance Criteria

- Phase 1 — UI and installable MVP: welcome screen, slideshow, registration/login interface, language switching, dashboard, categories and navigation.
- Phase 2 — Backend: secure authentication, database, profile management, favorites and admin panel.
- Phase 3 — Verified local content: populate the five Upazilas and categories with checked information.
- Phase 4 — Maps, search, correction reports, notices and content moderation.
- Phase 5 — Testing, bug fixing, signed APK and Play Store AAB preparation.

The MVP is accepted only when it installs on an Android phone, opens successfully, navigates between the agreed screens, changes all interface text between Bangla and English, and validates required registration fields. Clearly label any feature that is only a demo or not yet connected to a backend.

20. Final Instruction to the Developer

Please review this complete brief before starting. If a requirement is unclear, ask the project owner instead of silently changing it. Keep the product simple to use, colorful but tasteful, bilingual throughout and expandable in the future. Prioritize a working installable Android MVP, then complete the backend and remaining features in phases.

Project: JOYORA — The Digital Identity of Joypurhat
Founder: Saberin Sheikh

Location: Joypurhat, Bangladesh
